BEHAVIOR CIRCUIT

LOCATE YOUR VALUABLE DOG. KNOW WHAT YOUR DOG IS DOING.

A sophisticated **BEHAVIOR CIRCUIT** changes the transmitter collar's signal rate gradually as the dog moves. From a distance and without seeing your dog, you can tell whether your dog is **still, in slow motion, increasing speed or running**. The **BEHAVIOR CIRCUITRY** indicates a wide range of animal behavior. It offers more than the fast or slow pulse rates of an activity/tree switch.

When the dog is resting, entrapped, injured and down, standing still or **on point**, the **BEHAVIOR CIRCUIT'S** beeping signal will be about **30** pulses per minute. As the dog begins to move, the pulse will increase. When the dog is running full out, the radio signal will pulse at a rate of **120** beats per minute.

There are no special instructions for use. Simply buckle the collar on the dog, remove the magnet to start the signal transmission, and observe the change in pulse rate as the dog moves.

NOTE: WHEN THE MAGNET IS FIRST REMOVED, YOU WILL HEAR A LONG BEEP, FOLLOWED BY SEVERAL SHORT BEEPS. THEN REGULAR PULSING WILL BEGIN. THIS IS NORMAL, AS THE TRANSMITTER IS STARTING UP.

Parts and labor on ELECTRONICS in our transmitter collars and receivers are GUARANTEED for FIVE YEARS
